

Link to my project 2 video showing use cases:

<https://www.youtube.com/watch?v=fUj1SLdk8J0&t=18s>

Descriptions:

- How my system is set up to handle OrderLines
 - Basically, I provided another option on the main panel menu that allows a user to change a specific aspect of an order, saving is straightforward but in order to load an orderLine the user has to provide a orderID and an ProductID to ensure that the correct orderLine is pulled up
- How my tables are linked
 - Order linked to Customer
 - Whenever an order is saved, the system also creates a customer using the customerID from the Order entry, if the customer already exists, it updates the fields
 - Orderline linked to Order
 - Whenever a new order is created, a new orderline for that order is created
 - Orderline linked to products
 - Whenever an orderline is saved, the system also creates a product using the productID entry, if the product already exists it updates the fields
